

# Secure & Dependable System Homework 5

## 5.1

Recalling the definition of a class invariant as stated in the lecture notes, we get an understanding of what a class invariant is. This understanding is that a class invariant expresses some constraints that must be true at every stable point in time during the life of an object, which is why  $\text{length}(\text{elements}) == \text{size}$  is a sufficient class invariant, since according to the properties of stacks, the number of elements determine the size of the stack, therefore ~~any~~ at any point of time, the size of the stack is equal to the length of the elements, and this is a truth preserved by operations.

## 5.2

```
class Date (year: int, month: int, day: int)
```

```
  fun yesterday(): Date = { ... }
```

```
  fun tomorrow(): Date = { ... }
```

~~An~~ ~~the~~ A weak but useful <sup>class</sup> invariant would be -

$$\boxed{\text{day} \geq 1 \ \&\& \ \text{day} \leq 31 \ \&\& \ \text{month} \geq 1 \ \&\& \ \text{month} \leq 12}$$

A weak useful class invariant is that in the ~~a~~ Date - the <sup>month & year</sup> day cannot be negative, it is always a positive value, (since we know that day has to be  $\geq 1$  and  $\leq 31$  in the Date).

Implementation on next page -
